THE HUMAN DEBUG DECK

78-node memory array

78-node memory array · a tarot system for IT minds. Volatile human states, translated into objective, executable syntax. Pull a node, read its stack trace, patch the running process.

NODES	78 + 13 extension cards
FORMAT	Rigid box (print) · free web version

>_ THE ANALOG OVERRIDE

Reading the manual is easy when the CPU is cool. But when your system is actively crashing—an anxiety spike, a conflict, or a severe AR projection—your prefrontal cortex physically locks you out. Your internal GUI is compromised.

To bypass this rendering error, you must introduce external entropy. Drawing a physical node executes an active diagnostic trace. It forces your hardware to stop looping corrupted legacy scripts and translates your chaotic, 1-Billion-bit biological telemetry into a cold, executable grounding command.

[PRINT EDITION]

The physical edition of The Human Debug Deck — the full 78-node array plus 13 extension cards in a rigid box. Availability and shipping details are listed in the shop.

>_ INFRASTRUCTURE TOPOLOGY

Five subsystems. Every node carries its subsystem tag and classification in the meta line.

[CORE] KERNEL VARIABLES The deep subconscious and macro-architecture. These nodes govern massive life cycles, identity shifts, and the foundational archetypes running your master database.

[CPU] THE COMPUTE SUBSYSTEM The execution engine. This layer governs your bandwidth, kinetic action, focus, and thermal load. It dictates how you work and spend your energy.

[NET] THE NETWORK SUBSYSTEM The Social API. This layer governs interpersonal routing, empathy, boundaries, packet loss (miscommunications), and the execution of the stateless Love Protocol.

[SYS] THE OS SUBSYSTEM The cognitive architecture. This layer governs your threat-modeling, cold logic, the narrating mind (PR Department), and the confrontation of harsh, unencrypted truths.

[DISK] THE BARE_METAL SUBSYSTEM The physical chassis. This layer governs biological health, financial security, tangible assets, and the somatic baseline required to keep the server powered on.

>_ NODE CLASSIFICATION TAGS

[HW] Hardware — physical states & resources

[PROT] Protocol — rules, roles & interfaces

[EXEC] Execution — actions & running processes

[FAULT] Fault — errors, crashes & inversions
